

Stahlman Beekeeping Notes For 2022

Issue # 49 December 3, 2022

Download Cary's article [[Using Hive Temperature Sensors_Final_version.pdf](#)]

I am delighted to be able to share an article written by Cary Orange, a beekeeping friend. I have known Cary for two years and always find that some beekeepers add much to my beekeeping knowledge. In a technological age, I find myself having trouble keeping up with information data collection. I like the hands – on approach to beekeeping. In today's world, everything seems to have some [cloud connection]. Cary has the background and experience to help me see the future of beekeeping data collection and a willingness to share this with you. I come from that generation of the Kennedy years with the slogan "The torch is passed to a new generation." Time has gone from the 1960's to 2022 so fast.

While I mention changes, I was looking at some information from 1920. I have been writing about winter management. The hive shown here seemed to be a new advance to over-wintering hives during that period of time. Problem solved it says!

Hives get patented as this one did – Oct. 9, 1917.

I am just wondering if anyone is using an inner overcoat as shown in this illustration.

There are winter outer covers for sale today. I have never seen a hive design like this. A.I. Root sold a double wall hive called the Buckeye Hive during this period but it was not like this hive.
